BUS	310.	Exam	#2B.	Spring	2018
DUJ	JIU,	LAGIII	TLD,	JUILIE	LAUTO

Name	KET	
Section	· I	

Instructions: This exam is in two parts: Part I is to be completed partly at home using the materials posted on Blackboard for Part I and you will answer questions about that work in class below; Part II is to be completed entirely in class. You may not use cell phones, and you may only access internet resources you are specifically directed to use. You may access your data file for Part I of the exam in Blackboard. You may access the data files posted to Blackboard for the Exam part II. Be sure you are using the data file that matches the exam version you are given.

Part I: At Home

This part was completed at home. You can upload the Excel file for Part I to the Part I folder in Blackboard for use during the Exam period. However, this submission will not be graded in this location, it must be submitted to the "to be graded folder" to receive credit.

Part II: In Class

- 1. Use the work done at home to answer the Part I questions.
- 2. Open the file from the in-class portion of the final posted on Blackboard that corresponds to the version of the exam you have. This is Exam B.
- 3. Answer the questions corresponding to the data file, and any additional calculation in Excel required.
- 4. When you have finished answering questions on the exam, and all your answers have been recorded on the paper test for grading, upload **both** the <u>take home Excel file</u> and the <u>in-class Excel file</u> to the same in-class Exam folder in Blackboard for grading. Only those files submitted to the correct folder will be graded. (If in doubt, put all work in one Excel file.)
- 5. Turn in your paper copy of the exam to your instructor.
- Enjoy your break!

Part I:

1.	Report on the results of your ANOVA test of the cereal box filling machines. State your null and	
	alternative hypotheses, your test-statistic and P-value, and the conclusion of your test. Give a	
	sentence to explain the meaning of the test in context understandable by a lay person. (12 points	s)

Ho: all means are equal Ho: at least one mean is different

F= 326.88 P-value: 1.268×10-37 <.05 reget null

at least one machine fells boxes differently

2. Examine your boxplots. Is the equal variance assumption approximately satisfied? Why or why not? (6 points)

no, vanance of machine 1 is 6 Ames larger Than Jor Machine 5

3. Based on the results of your test, and the box plots, which filling machine(s) appears to be the most different from the others and is most in need of recalibration? (Or if no recalibration is needed.) Explain. (6 points)

Machine 4 and Machine 5 are most defficient but all machines appear to need calibration. only Machine 1 Spans 10 0 Z

4. Report on the findings of your χ^2 -test of independence. State the null and alternative hypotheses, your test statistic and P-value, and the conclusion. Give a sentence that summarizes the meaning of the test that a lay person can understand. (12 points)

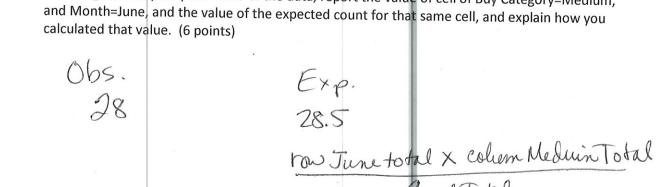

Ho: the variables month and buy category are independent

Hi the variables are dependent

P-value: .30 >.05 fair to regit null

the variables month and buy category appear to be

unrelated

5. Referring back to your pivot table of the data, report the value of cell of Buy Category=Medium,

6. Consider the data on the two ads. Is the data dependent or independent? Explain. (10 points)

dependent Since They are Seen by The Same person

7. Report on the results of the *t*-test. State any assumptions made about the data, and the type of test conducted, the null and alternative hypotheses, the test-statistic and P-value, and the conclusion of the test. Summarize the results in a single sentence that can explain the results in context to a lay person unfamiliar with statistics. (15 points)

Ho:
$$\mu_1 = \mu_2$$
 or $\partial_0 = 0$

Ha: $\mu_1 < \mu_2$ or $\partial_0 \ge 0$ ($\mu_2 - \mu_1 > 0$)

P-value: 4.16 ×10⁻¹³ < .05 reject null

The second ad appears to be more effective

8. State your final regression equation and explain your reasoning as to why you chose this option. Report the R^2 value for the equation you choose. (12 points)

Y = -2570 38x1 + 1.6965x2

QTY = -2570.38 (Price) + 1.6965 (Ads)

R2 = . 9965

P-values are <.05 for all variables constant eliminated due to high P-value when pice included

9. What proportion of the variability in quantity sold can be explained by the variables you chose? (6 points)

99.65%

(makh R2 value)

10. Use the slope for Average Price, interpret the value of the slope in the context of the problem. (8 points)

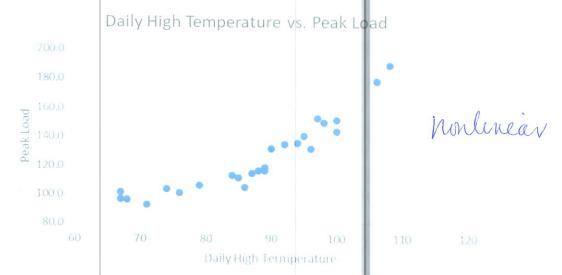

-2570.38

for each extra dollar in average price the quantity sold goes down by 2570 units.

Calculations in Excel: (1) 25 points, (2) 25 points, (3) 20 points, (4) 40 points.

Part II:

11. Included below is a scatterplot of peak load vs. daily temperature. Based on the graph, does the data appear to be linear or nonlinear? (6 points)

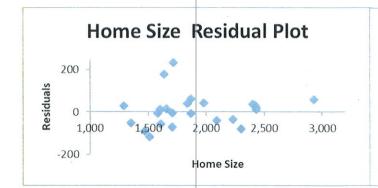

12. Using the trendline option on the graph, compare a linear regression line (and R^2 value) with a polynomial (degree two) regression equation. Report the R^2 values and equations of both and indicate which is the better model. (9 points)

linear
$$Y = 1.9765 \times -47.394$$
 $Y = 0.0598 \times ^2 - 8.2925 \times +385.05$ $R^2 = 0.8433$ $R^2 = 0.9594$ better model

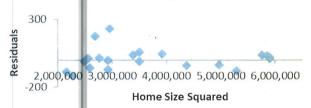

13. Use the best equation to predict the peak load for an average daily temperature of 63° in your best equation. (6 points)

99.97 ~ 100

14. The regression output for the quadratic (polynomial degree-2 model) is shown on the next page along with the residual plots. Use this information to answer the questions that follow.

Home Size Squared Residual Plot

What information do we get from residual plots? Which regression assumptions are we testing? (6 points)

equal variance we can also kest bias, linearity/fit of model qualitatively

b. What is the standard error? Interpret the meaning of this value in context? (6 points)

91.75 St. deviations of the livers (deviations).

from regression line

State a 90% confidence interval for the coefficient of Home Size. (6 points)

(1.639, 3.05)

d. Conduct a hypothesis test on the coefficient of Home Size Squared in the equation. State the hypothesis, test statistic and P-value, and interpret the results in the context of the problem. (8 points)

Ho: \$2=0 Ha: Ba + O

T=-4.459 P-value .00019 <.05 , reject null

Home size predicts monthly usage model not linear

keep coels/variable in equation, coels. not Zero

SUMMARY OUTPUT

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}$$

$$\sigma_{\widehat{p}} = \sqrt{\frac{p(1-p)}{n}}$$

$$\sigma_{\bar{x}} = \frac{\sigma}{\sqrt{n}}$$
 $\sigma_{\hat{p}} = \sqrt{\frac{p(1-p)}{n}}$ $s_{pooled} = \sqrt{\frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1 + n_2 - 2}}$

$$s_{x_1 - x_2} = s_{pooled} \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}$$

Sample sizes:
$$n > \hat{p}(1-\hat{p})\left(\frac{z_{\alpha/2}}{E}\right)^2$$

$$n > \left(\frac{z_{\alpha/2}\sigma}{F}\right)^2$$

$$n > \left(\frac{z_{\alpha/2}\sigma}{E}\right)^2$$
 $m = n = \frac{4z_{\alpha/2}^2(\sigma_1^2 + \sigma_2^2)}{w^2}$

Confidence intervals:

$$\bar{x} \pm t_{\alpha/2,n-1} \frac{s}{\sqrt{n}}$$

Two samples (independent):
$$(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, n-1} \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$$
 $(\hat{p}_1 - \hat{p}_2) - z_{\alpha/2} \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$

$$\hat{p} \pm z_{\alpha/2} \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$$

$$(\hat{p}_1 - \hat{p}_2) - z_{\alpha/2} \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$$

Test statistics:

One sample:
$$z \ or \ t = \frac{\bar{x} - \mu_0}{s / \sqrt{n}}$$

$$z = \frac{\hat{p} - p_0}{\sqrt{p_0(1 - p_0)/n}}$$

Two samples: dependent:
$$z$$
 or $t = \frac{\bar{d}_0 - \delta}{\frac{S_d}{\sqrt{n}}}$

Independent:
$$z$$
 or $t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}$

$$z = \frac{(\hat{p}_1 - \hat{p}_2) - (p_1 - p_2)}{\sqrt{\frac{p_1(1 - p_1)}{n_1} + \frac{p_2(1 - p_2)}{n_2}}}$$

Degrees of freedom (two samples, unpooled)
$$\nu = \frac{\left(\frac{s_1^2}{m} + \frac{s_2^2}{n}\right)^2}{\left(\frac{s_1^2}{m}\right)^2 + \left(\frac{s_2^2}{n}\right)^2}$$

$$\chi^2$$
Tests

$$\chi^2$$
Tests: $\chi^2 = \sum_{all\ cells} \frac{(obs - exp)^2}{exp}$

$$MSE = \frac{\left(\sum_{j=1}^{J} n_{j} (\bar{Y}_{j} - \bar{Y})^{2}\right)}{J-1}$$
 $MSS = \sum_{j=1}^{J} \frac{(n_{j}-1)s_{j}^{2}}{n-J}$ $F = \frac{MSE}{MSS}$

$$MSS = \sum_{j=1}^{J} \frac{(n_j - 1)s_j^2}{n - J}$$

$$F = \frac{MSE}{MSS}$$

Upload your completed Excel files to the Exam #2 submission box in Blackboard, and submit your completed paper exam to your instructor. You may not modify anything once the exam is submitted.
