IT-234 – database concepts

UNIT 2 – THE LOGICAL DATABASE MODEL AND DATABASE NORMALIZATION

Logical database design typically entails synthesizing individual data elements into normalized tables after careful analysis of data element interdependencies defined by business requirements analysis.

The logical data model specifically adds attributes, primary keys, and foreign keys.

The tables will be able to store data about the organization's entities in a non-redundant manner, and foreign keys will be placed in the tables so that all the relationships among the entities will be supported.

You are adding more detail to your data model, but there is still no dependence on any database system.

The logical data model will be describing the data requirements from a business point of view.

The goal of logical database design is to create wellstructured relations that properly reflect the company's business environment.

After completing this unit, you should be able to:

- Identify attributes for entities in the database.
- Define data type and nullability.
- Identify all primary keys for entities in the database.
- Recognize any foreign keys required for entities in the database.
- Create an entity relationship diagram (ERD) that reflects the logical data model.

Database maintenance Ensure that evolving information requirements are met

- Nissenance · Add, delete, or changes characteristics of the structure of a database in order to:
 - meet changing business conditions
 - correct errors
 - improve performance.
- Fix errors and recover database when it is contaminated

Implementatios Database implementation

- Create and test the database
- Complete database documentation and training materials
- Install database and convert data from prior systems

Enterprise modeling

Planning

Design

- Analyze current data processing
 - Analyze the general business functions and their database needs

Conceptual data modeling

- Develop preliminary conceptual data model. Analysis
 - Compare preliminary conceptual data model with enterprise data model
 - Develop detailed conceptual data model

Logical database design

- Transform conceptual data model into relations
- Normalization

Physical database design

 Specify the organization of physical records, the choice of file organizations, and the use of indexes

Database life cycle

Components of THE relational model

Data structure

• Tables (relations), rows, columns

Data manipulation

 Powerful SQL operations for retrieving and modifying data

Data integrity

• Mechanisms for implementing business rules that maintain integrity of manipulated data

RelationS

A relation is a named, two-dimensional table of data.

A table consists of rows (records) and columns (attribute or field).

Requirements for a table to qualify as a relation:

- •It must have a unique name.
- Every attribute value must be atomic (not multivalued, not composite).
- •Every row must be unique (can't have two rows with exactly the same values for all their fields).
- Attributes (columns) in tables must have unique names.

NOTE: All relations are in 1st Normal form.

RELATIONS

Relations (tables) correspond with entity types and with many-to-many relationship types.

Rows correspond with entity instances and with manyto-many relationship instances.

Columns correspond with attributes.

NOTE: The word **relation** (in relational database) is NOT the same as the word **relationship** (in E-R model).

Key Fields

Keys are special fields that serve two main purposes:

- Primary keys are <u>unique</u> identifiers of the relation. Examples include employee numbers, social security numbers, etc. This guarantees that all rows are unique.
- Foreign keys are identifiers that enable a <u>dependent</u> relation (on the many side of a relationship) to refer to its <u>parent</u> relation (on the one side of the relationship).
- Keys can be simple (a single field) or composite (more than one field).
- Keys usually are used as indexes to speed up the response to user queries

Schema for four relations (Pine Valley Furniture Company)

Referential integrity constraints (Pine Valley Furniture) REFERENTIAL INTEGRITY CONSTRAINTS ARE DRAWN VIA ARROWS FROM DEPENDENT TO PARENT TABLE

CREATE TABLE Customer_T

	(CustomerID	NUMBER(11,0)	NOT NULL,
	CustomerName	VARCHAR2(25)	NOT NULL,
/	CustomerAddress	VARCHAR2(30),	
/	CustomerCity	VARCHAR2(20),	
	CustomerState	CHAR(2),	
	CustomerPostalCode	VARCHAR2(9),	

CONSTRAINT Customer_PK PRIMARY KEY (CustomerID));

CREATE TABLE Order_T

(OrderID	NUMBER(11,0) NOT NULL,
OrderDate	DATE DEFAULT SYSDATE,
CustomerID	NUMBER(11,0),

CONSTRAINT Order_PK PRIMARY KEY (OrderID),

CONSTRAINT Order_FK FOREIGN KEY (CustomerID) REFERENCES Customer_T (CustomerID));

CREATE TABLE Product_T

(ProductID	NUMBER(11,0) NOT NULL,
ProductDescription	VARCHAR2(50),
ProductFinish	VARCHAR2(20),
ProductStandardPrice	DECIMAL(6,2),
ProductLineID	NUMBER(11,0),

CONSTRAINT Product_PK PRIMARY KEY (ProductID));

CREATE TABLE OrderLine_T

(OrderID	NUMBER(11,0)	NOT NULL,
ProductID	NUMBER(11,0)	NOT NULL,
OrderedQuantity	NUMBER(11,0),	

CONSTRAINT OrderLine_PK PRIMARY KEY (OrderID, ProductID), CONSTRAINT OrderLine_FK1 FOREIGN KEY (OrderID) REFERENCES Order_T (OrderID), CONSTRAINT OrderLine_FK2 FOREIGN KEY (ProductID) REFERENCES Product_T (ProductID)); Referential integrity constraints are implemented with foreign key to primary key references

SQL table definitions

Transforming ER Diagrams into Relations

Mapping Regular Entities to Relations

- Simple attributes: E-R attributes map directly onto the relation
- Composite attributes: Use only their simple, component attributes
- Multivalued Attribute: Becomes a separate relation with a foreign key taken from the superior entity

CUSTOMER ENTITY TYPE WITH SIMPLE ATTRIBUTES

CUSTOMER <u>Customer ID</u> Customer Name Customer Address Customer Postal Code

CUSTOMER

CustomerID CustomerName CustomerAddress CustomerPostalCode

CUSTOMER relation

Mapping a Regular Entity

CUSTOMER entity type with composite attribute Customer Name Customer Address (Customer Street, CustomerCity, CustomerState) Customer Postal Code

CUSTOMER relation with address detail

CUSTOMER					
CustomerID	CustomerName	CustomerStreet	CustomerCity	CustomerState	CustomerPostalCode

Mapping a Composite Attribute

One-to-many relationship between original entity and new relation

Mapping an Entity with a Multivalued Attribute

Transforming ER Diagrams into Relations (cont.)

Mapping Binary Relationships

- One-to-Many-Primary key on the one side becomes a foreign key on the many side
- Many-to-Many-Create a new relation with the primary keys of the two entities as its primary key
- One-to-One-Primary key on mandatory side becomes a foreign key on optional side

RELATIONSHIP BETWEEN CUSTOMERS AND ORDERS

The *Completes* relationship will need to become a separate relation.

Example of Mapping an M:N Relationship "COMPLETES" RELATIONSHIP (M:N)

Example of Mapping an M:N Relationship (cont.)

THREE RESULTING RELATIONS

Example of Mapping a Binary 1:1 Relationship "IN CHARGE" RELATIONSHIP (BINARY 1:1)

Foreign key goes in the relation on the optional side, matching the primary key on the mandatory side

Example of Mapping a Binary 1:1 Relationship (cont.) RESULTING RELATIONS

Transforming ER Diagrams into Relations (cont.)

Mapping Associative Entities

- Identifier Not Assigned
 - Default primary key for the association relation is composed of the primary keys of the two entities (as in M:N relationship)
- Identifier Assigned
 - It is natural and familiar to end-users
 - Default identifier may not be unique

Example of Mapping an Associative Entity

Composite primary key formed from the two foreign keys

Example of Mapping an Associative Entity (cont.)

Example of Mapping an Associative Entity with an Identifier SHIPMENT ASSOCIATIVE ENTITY

Three Resulting Relations

Example of Mapping an Associative Entity with an Identifier (cont.)

Transforming ER Diagrams into Relations (cont.)

Mapping Unary Relationships

- One-to-Many Recursive foreign key in the same relation
- Many-to-Many Two relations:
 - > One for the entity type
 - One for an associative relation in which the primary key has two attributes, both taken from the primary key of the entity

Mapping a Unary 1:N Relationship

Mapping a unary M:N relationship

Mapping Ternary (and n-ary) Relationships

- One relation for each entity and one for the associative entity
- Associative entity has foreign keys to each entity in the relationship

Transforming ER Diagrams into Relations (cont.)

Mapping a Ternary Relationship PATIENT TREATMENT TERNARY RELATIONSHIP WITH ASSOCIATIVE ENTITY

Mapping a Ternary Relationship (cont.)

Mapping the ternary relationship PATIENT TREATMENT

Remember that the primary key MUST be unique.This i treatme and time includer primary	s why But this makes ent date a very ne are cumbersome d in the key posite ry key.	It would be better to create a surrogate key like Treatment#.
---	---	---

Mapping a Ternary Relationship (cont.)

Mapping the ternary relationship PATIENT TREATMENT

Data Normalization

Primarily a tool to validate and improve a logical design so that it satisfies certain constraints that **avoid unnecessary duplication of data**

The process of decomposing relations with anomalies to produce smaller, **well-structured** relations
Well-Structured Relations

A relation that contains minimal data redundancy and allows users to insert, delete, and update rows without causing data inconsistencies

Goal is to avoid anomalies

- Insertion Anomaly–adding new rows forces user to create duplicate data
- Deletion Anomaly-deleting rows may cause a loss of data that would be needed for other future rows
- Modification Anomaly-changing data in a row forces changes to other rows because of duplication

General rule of thumb: A table should not pertain to more than one entity type.

EMPLOYEE2

EmpID	Name	DeptName	Salary	CourseTitle	DateCompleted
100	Margaret Simpson	Marketing	48,000	SPSS	6/19/2015
100	Margaret Simpson	Marketing	48,000	Surveys	10/7/2015
140	Alan Beeton	Accounting	52,000	Tax Acc	12/8/2015
110	Chris Lucero	Info Systems	43,000	Visual Basic	1/12/2015
110	Chris Lucero	Info Systems	43,000	C++	4/22/2015
190	Lorenzo Davis	Finance	55,000	Tax Acc	
150	Susan Martin	Marketing	42,000	SPSS	6/19/2015
150	Susan Martin	Marketing	42,000	Java	8/12/2015

Question–Is this a relation?

Answer–Yes: Unique rows and no multivalued attributes

Question–What's the primary key?

Answer–Composite: EmpID, CourseTitle

Anomaly Example

- Insertion-can't enter a new employee without having the employee take a class (or at least empty fields of class information)
- **Deletion**-if we remove employee 140, we lose information about the existence of a Tax Acc class
- **Modification**–giving a salary increase to employee 100 forces us to update multiple records

Why do these anomalies exist?

Because there are two themes (entity types) in this one relation. This results in data duplication and an unnecessary dependency between the entities. Anomalies in this Table

Steps in Normalization

3RD NORMAL FORM IS GENERALLY CONSIDERED SUFFICIENT

Functional Dependencies and Keys

Functional Dependency: The value of one attribute (the determinant) determines the value of another attribute

Candidate Key:

- A unique identifier. One of the candidate keys will become the primary key
 - e.g., perhaps there is both credit card number and SS# in a table...in this case both are candidate keys.
- Each non-key field is functionally dependent on every candidate key.

First Normal Form

No multivalued attributes

Every attribute value is atomic

The example on the next slide is not in 1^{st} Normal Form (multivalued attributes) \rightarrow it is not a relation.

The example on the subsequent slide *is* in 1st Normal form.

All relations are in 1st Normal Form.

Table with multivalued attributes, not in 1st normal form

INVOICE data (Pine Valley Furniture Company)

<u>OrderID</u>	Order Date	Customer ID	Customer Name	Customer Address	ProductID	Product Description	Product Finish	Product StandardPrice	Ordered Quantity
1006	10/24/2015	2	Value Furniture	Plano, TX	7	Dining Table	Natural Ash	800.00	2
					5	Writer's Desk	Cherry	325.00	2
					4	Entertainment Center	Natural Maple	650.00	1
1007	10/25/2015	6	Furniture Gallery	Boulder, CO	11	4–Dr Dresser	Oak	500.00	4
					4	Entertainment Center	Natural Maple	650.00	3

Note: This is NOT a relation.

Table with no multivalued attributes and unique rows, in 1st normal form

INVOICE relation (1NF) (Pine Valley Furniture Company)

OrderID	Order Date	Customer ID	Customer Name	Customer Address	ProductID	Product Description	Product Finish	Product StandardPrice	Ordered Quantity
1006	10/24/2015	2	Value Furniture	Plano, TX	7	Dining Table	Natural Ash	800.00	2
1006	10/24/2015	2	Value Furniture	Plano, TX	5	Writer's Desk	Cherry	325.00	2
1006	10/24/2015	2	Value Furniture	Plano, TX	4	Entertainment Center	Natural Maple	650.00	1
1007	10/25/2015	6	Furniture Gallery	Boulder, CO	11	4–Dr Dresser	Oak	500.00	4
1007	10/25/2015	6	Furniture Gallery	Boulder, CO	4	Entertainment Center	Natural Maple	650.00	3

Note: This is a relation, but not a well-structured one.

- Insertion if new product is ordered for order 1007 of existing customer, customer data must be re-entered, causing duplication
- Deletion if we delete the Dining Table from Order 1006, we lose information concerning this item's finish and price
- Update changing the price of product ID 4 requires update in multiple records

Why do these anomalies exist?

Because there are multiple themes (entity types) in one relation. This results in duplication and an unnecessary dependency between the entities.

Anomalies in this Table

SalesStaff						
EmployeeID	SalesPerson	SalesOffice	OfficeNumber	Customer1	Customer2	Customer3
1003	Mary Smith	Chicago	312-555-1212	Ford	GM	
1004	John Hunt	New York	212-555-1212	Dell	HP	Apple
1005	Martin Hap	Chicago	312-555-1212	Boeing		

What are the Major Problems with this Approach?

Alternate Approach

Handling Multi-Value Attributes by Adding Fields to the Table

Second Normal Form

INF PLUS every non-key attribute is fully functionally dependent on the ENTIRE primary key

- Every non-key attribute must be defined by the entire key, not by only part of the key
- No partial functional dependencies

OrderID → OrderDate, CustomerID, CustomerName, CustomerAddress CustomerID → CustomerName, CustomerAddress ProductID → ProductDescription, ProductFinish, ProductStandardPrice OrderID, ProductID → OrderQuantity

Therefore, NOT in 2nd Normal Form

Functional Dependency Diagram for INVOICE

Partial dependencies are removed, but there are still transitive dependencies

Removing Partial Dependencies

Third Normal Form

2NF PLUS **no transitive dependencies** (functional dependencies on non-primarykey attributes)

•

Note: This is called transitive, because the primary key is a determinant for another attribute, which in turn is a determinant for a third

 \longleftrightarrow

Solution: Non-key determinant with transitive dependencies go into a new table; non-key determinant becomes primary key in the new table and stays as foreign key in the old table

Transitive dependencies are removed.

The following diagram shows the result of normalization, yielding four separate relations where initially there was only one.

Removing Transitive Dependencies

Our first task is to present the data in a tabular format as shown on the next slide. Looking at this data, we can see that we are not in first normal form because we have no keys, repeating groups and multi-valued fields.

Client	Address	Phone	Pet 1	Pet 2	Pet 3	Pet 4	Visits
Mary	55 Rhodes	555-	Boomer,	Trixie,	Fred, Mixed		March 10 at
Jones	St	290-	Chihuahua	Schnauzer			2:00pm (<u>check</u>
		3083					<u>up</u>)
							Boomer, Trixie,
							Fred
							March 25 at
							8:00am (spay)
							Trixie
Jerome	37583	555-	Esmerelda,				May 27 at
Franklin	Respite	450-	Bulldog				1:00pm (<u>check</u>
	Pines Lane	4999					<u>up</u>)
							June 15 at
							8:00am
							(grooming)
							August 5 at
							8:00am
							(grooming)

Things you should consider to understand why this data is not normalized:

What happens when a customer has a fifth pet? Do we re-size the entire database to add that column? What about a sixth, seventh or more?

When most customers only have one or two pets, we still have additional space being used for pet 3, pet 4 and so on. How do we search for values in a multi-valued field like visits? This can be a processing nightmare and involves a lot of overhead.

How do we get our vet database to first normal form (1NF)? To be in first normal form we need:

- Unique primary key
- One set of values per column
- One value per cell

To improve upon this, we will start by normalizing the data into first normal form.

1NF:

Each table cell should contain a single value.

Each record needs to be unique.

Client	Address	Phone	Pet	Breed	Visits
Mary Jones	55 Rhodes St	555-290-3083	Boomer	Chihuahua	March 10 at 2:00pm (<u>check up</u>)
Mary Jones	55 Rhodes St	555-290-3083	Trixie	Schnauzer	March 10 at 2:00pm (<u>check up</u>)
Mary Jones	55 Rhodes St	555-290-3083	Trixie	Schnauzer	March 25 at 8:00am (spay)
Mary Jones	55 Rhodes St	555-290-3083	Fred	Mixed	March 10 at 2:00pm (<u>check up</u>)
Jerome Franklin	37583 Respite Pines Lane	555-450-4999	Esmerelda	Bulldog	May 27 at 1:00pm (<u>check up</u>)
Jerome Franklin	37583 Respite Pines Lane	555-450-4999	Esmerelda	Bulldog	June 15 at 8:00am (grooming)
Jerome Franklin	37583 Respite Pines Lane	555-450-4999	Esmerelda	Bulldog	August 5 at 8:00am (grooming)
Pat Cooper	1250 50 th Avenue	555-408-3803	Snots	Mixed	September 12 at 4:00pm (<u>check up</u>)
Pat Cooper	1250 50 th Avenue	555-408-3803	Spot	Mixed	
Pat Cooper	1250 50 th Avenue	555-408-3803	Sam	Poodle	
Pat Cooper	1250 50 th Avenue	555-408-3803	Suzy	Great Dane	September 12 at 4:00pm (<u>check up</u>)

TABLE IN 1NF

When we look at the data normalized to first normal form, we see that we still have some issues.

- Insertion anomalies
 - Data about more than one entity in the relation forces you to insert data about an unrelated entity
 - Deletion anomalies
 - Part of the primary key of a row becomes null when the data are deleted, forcing you to remove the entire row. The result of a deletion anomaly is the loss of data that you would like to keep.
- Update anomalies
 - If every row is not changed, then data that should be the same are no longer the same. The potential for these inconsistent data is the modification anomaly

To alleviate some of the issues we find in first normal form, we will continue normalizing the data to second normal form.

2NF:

- The relation is in first normal form.
- All non-key attributes are functionally dependent on the entire primary key.

We start by isolating each group of data into its own entity.

What is functionally dependent upon client id? The information about the client itself (name, address, phone):

Client

ClientID	Client	Address	Phone
1	Mary Jones	55 Rhodes St	555-290-3083
2	Jerome Franklin	37583 Respite Pines Lane	555-450-4999
3	Pat Cooper	1250 50 th Avenue	555-408-3803

The pets can be isolated to their own entity as well. We'll use the primary key from the client entity, ClientID, to tie the clients to their pets. Remember – they could have multiple pets. This structure allows any given client to have any number of entries in the pet entity without worrying about having to resize the database again and again.

Pet

PetID	Pet	Breed	ClientID
1	Boomer	Chihuahua	1
2	Trixie	Schnauzer	1
3	Fred	Mixed	1
4	Esmerelda	Bulldog	2
5	Snots	Mixed	3
6	Spot	Mixed	3
7	Sam	Poodle	3
8	Suzy	Great Dane	3

The visits can be isolated to their own entity. We'll use the primary key from the client entity, ClientID, to tie the clients to their visits. Remember – they could have multiple pets. This structure allows any given client to have any number of visit records.

Visit

<u>VisitID</u>	VisitDate	VisitTime	VisitReason	ClientID
1	March 10	2:00pm	Check Up	1
2	March 25	8:00am	Spay	1
3	May 27	1:00pm	Check Up	2
4	June 15	8:00am	Grooming	2
5	August 5	8:00am	Grooming	2
6	September 12	4:00pm	Check Up	3

Next we'll deal with how pets are tied to their visits. Recall that our conceptual diagram depicted a many-to-many relationship between pets and visits. In order to create this type of relationship, we need another table to serve as the go between so that one pet can tie to zero or more visit records and one visit record can tie to one or more pets. We can accomplish this by creating a new table as shown to the right.

PetVisit

PetID	<u>VisitID</u>
1	1
2	1
2	2
3	1
4	3
4	4
4	5
5	6
8	6

- In order to reach third normal form, we are going to break out the pets and their breeds.
- In theory, the vet could store information about various breeds unrelated to the actual client's pets.
- So, we will create a new entity to store breeds and modify the pet entity to relate to it.

-		
- 13	0	٠
•	c	s.
-	_	_

PetID	Pet	BreedID	ClientID
1	Boomer	2	1
2	Trixie	6	1
3	Fred	4	1
4	Esmerelda	1	2
5	Snots	4	3
6	Spot	4	3
7	Sam	5	3
8	Suzy	3	3

Breeds

	BreedID	Breed
	1	Bulldog
	2	Chihuahua
	3	Great Dane
	4	Mixed
	5	Poodle
	6	Schnauzer
	7	Siberian Husky
	8	Shih Tzu

Keep in mind that this part of the modeling process requires you to think about the scenarios that might exist using sample data but you're not dealing with the exact data when designing a database.

Multiply this scenario by thousands of records for any given entity and you'll easily see why we use such small samples to work through this process.

Next, we will document our logical design.

The logical design will depict the entities and relationships but will also include the attributes and primary/foreign key information for this normalized design.

Unit 2 To Do!

Reading & Videos

Discussion Forum

Seminar (or Alternative)

Assignment

UNIT 2 ASSIGNMENTS

UNIT 2 ASSIGNMENT 1

Purpose:

When designing databases, you create three models: conceptual, logical, and physical. This Assignment in Unit 2 asks you to use sound reasoning to create a logical data model based on the Movies Dataset.

You use critical thinking skills to identify entities and relationships between the entities. Data models are used in a variety of business scenarios to describe the organization's data.

UNIT 2 ASSIGNMENT 1

► Assignment Instructions:

Continue to normalize the design and create a logical model using the conceptual data model created in the last unit and leveraging the same Movies Dataset
Assignment Instructions:

In a Word document, write the following:

• For each of the entities, define all of the attributes. Define the data type and nullability of each attribute. Explain your choices.

Assignment Instructions:

For each of the entities, define the primary key. Define the data type and nullability. Explain your choices.

For each of the entities, define any foreign keys. Define the data type and nullability of each key. Explain your choices.

Assignment Instructions:

Create a logical model diagram using Microsoft Visio. Refer to the learning activity for an example. Please embed the Visio diagram in your Word document so that you are only submitting a single document for this Assignment.

Assignment Instructions:

• What did you refer to while working on this Assignment?

• Annotate those as your references at the end of the paper.

Assignment Instructions:

Be sure your work demonstrates the ability to apply critical thinking skills to illustrate sound reasoning.

This includes the ability to identify entities, formulate inferences and identify relationships between entities, identify faulty reasoning, assess assumptions, formulate conclusions, and assess what you referred to while you worked on this Assignment.

Assignment Requirements:

- Generate the logical design diagram using Microsoft Visio.
- Microsoft Visio can be obtained at no cost from the Microsoft Azure Dev Tools for Teaching site, which is accessible from the Course Resources section.

Assignment Requirements:

Compose your Assignment in a Word document and be sure to identify yourself, your class, and unit Assignment at the top of your paper.

Copy the design diagram(s) into your Word document. Be sure to use appropriate APA format and cite your textbook or other sources that you used in the assignment.

Directions for Submitting Your Assignment:

- Name your assignment document according to this convention: IT234_<YourName>_Unit2_Assn1.docx (replace <YourName> with your full name). Submit your completed assignment to the Unit 2 Assignment 1 Dropbox by the final day of the Unit 2 week.
- Review the Unit 2 Assignment 1 Rubric before beginning this activity.

▶Purpose:

- The individual assignments for Units 1 and 2 focus on the conceptual and logical models of the Movies Database.
- In this group exercise, you will use the process of creating a logical design for a new scenario associated with building a new patient database.

Your group will use a provided medical data form to collect medical information that may be used by a doctor's office for the basis of discussion and creation of the diagram representing the logical model of the database.

Assignment Instructions:

- Your instructor will divide you up into groups.
- You will meet with your group to prepare a diagram of a logical model based on the form provided.
- The layout of this logical diagram is the same as that used in the Unit 2 assignment and will be generated using Microsoft Visio.

Assignment Instructions:

A suggestion for collaboration would be for each team to meet two times.

The team could first meet to outline and assign responsibilities for creating tables that will be included in the final diagram.

Team members will then create their tables, and then the team could meet again to consolidate and synthesize a final diagram.

Assignment Download and use the Medical Data Form as the basis for your analysis.

Annotate any references you use at the end of the diagram.

Each team member should submit a copy of the final conceptual diagram along with their completed peer evaluation form.

Access the Unit 2 Team Area Discussion

Assignment Instructions:

- For each of the entities, define the primary key. Define the data type and nullability. Explain your choices.
- For each of the entities, define any foreign keys. Define the data type and nullability of each key. Explain your choices.

► Assignment Instructions:

Create a logical model diagram using Microsoft Visio. Refer to the learning activity for an example. Please embed the Visio diagram in your Word document so that you are only submitting a single document for this Assignment.

Assignment Requirements:

Generate the conceptual design diagram using Microsoft Visio. Microsoft Visio can be obtained at no cost from the Microsoft Azure Dev Tools for Teaching site.

Assignment Requirements:

Compose your Assignment in a Word document and be sure to identify yourself, your class, and unit Assignment at the top of your paper.

Copy the design diagram(s) into your Word document.

<u>The group assignment is due by the final day of</u> <u>the Unit 7 week</u>.

Directions for Submitting Your Assignment:

Name your assignment document according to this convention: IT234_<YourName>_Unit2_Assn2.docx (replace <YourName> with your full name). Submit your completed assignment to the Unit 2 Assignment 2 Dropbox by the final day of the Unit 2 week.

Review the Unit 2 Assignment 2 Rubric before beginning this activity.
